#### REPORT

RELATING TO THE REGISTRATION OF

# BIRTHS, MARRIAGES AND DEATHS

IN THE

### PROVINCE OF ONTARIO

FOR THE

YEAR ENDING 31st DECEMBER

1949

(EIGHTIETH ANNUAL REPORT)

Digitized by the Internet Archive in 2023 with funding from University of Toronto

SIR:

I have the honour to submit for your approval the Eightieth Annual Report made in conformity with and under the provisions of the Act resepecting the Registration of Births, Marriages and Deaths in the Province of Ontario, for the year ending December 31st, 1949.

I have the honour to be, Sir,

Your obedient servant,

R. B. WALLACE, Deputy Registrar-General.

To the Hon. G. H. Dunbar, Registrar-General of Ontario.

\*Detailed information regarding the above cities on file in the Registrar-General's Branch will be furnished upon receipt of a written request.

#### INTRODUCTION

This report is divided into two parts. Part I consists of an analytical survey of the Vital Statistics of the province in the form of narrative summaries, summary tables and charts. Its objectives are (1) to indicate (in so far as can be portrayed by vital statistics) the general trend over the past several years, in the general state of the health of the people of Ontario; (2) to assess the vital statistics of 1949 in the light of these general trends; and (3) to bring to light certain specific problems in the field of public health, such as infant and maternal mortality and deaths from specific diseases such as cancer and tuberculosis and those resulting from accidental causes. Part II consists of detailed tables covering vital statistics for the year 1949. In the interests of economy several tables are not printed in this report. These are listed in the Table of Contents and the information is available upon request providing that such requests, in the opinion of the Registrar-General, are sufficiently warranted and urgent in the public interest.

#### PART I.—COMPARATIVE AND ANALYTICAL SUMMARY

#### Population

For reference purposes the estimated population of the province over a period of about two decades is shown by sex in Table A, while a distribution by sex and age-groups of the estimated population of 1949 is provided in Table B.

TABLE A—POPULATION, CENSUSES 1921, 1931 AND 1941 AND ESTIMATED FOR INTERCENSAL YEARS, BY SEX, ONTARIO

Year	Total	Male	Female	Year	Total	Male	Female
1921 1922 1923 1924 1925 1926 1927 1928 1929 1930 1931 1932	2,933,662 2,980,000 3,013,000 3,015,000 3,111,000 3,219,000 3,219,000 3,278,000 3,334,000 3,431,683 3,473,000	1,481,890 1,507,000 1,525,000 1,550,000 1,578,000 1,606,000 1,666,000 1,696,000 1,724,000 1,748,844 1,769,000	1,451,772 1,473,000 1,488,000 1,509,000 1,533,000 1,558,000 1,584,000 1,612,000 1,638,000 1,662,000 1,682,839 1,704,000	1936 1937 1938 1939 1940 1941 1942 1943 1944 1945 1946 1947	3,606,000 3,637,000 3,672,000 3,708,000 3,747,000 3,787,655 3,884,000 3,917,000 4,004,000 4,101,000 4,189,000	1,835,000 1,850,000 1,867,000 1,885,000 1,904,000 1,921,201 1,966,000 2,005,600 2,016,600 2,068,300 2,113,000	1,771,000 1,787,000 1,805,000 1,805,000 1,823,000 1,843,000 1,866,454 1,918,000 1,934,000 1,959,400 2,032,700 2,076,000
1933 1934 1935	3,512,000 3,544,000 3,575,000	1,788,000 1,804,000 1,820,000	1,724,000 1,740,000 1,755,000	1948 1949	4,297,000 4,411,000	2,170,000 2,231,200	2,127,000 2,179,800

The estimated populations for 1932 to 1940 and 1942 have been revised and the necessary adjustments have been made in the tables showing rates.

TABLE B—ESTIMATED POPULATION OF ONTARIO, BY SEX AND AGE-GROUP, 1949

Age-Group	Total	Male	Female	Age-Group	Total	Male	Female
Under 5 5-9 10-14	319,900	232,900 184,600 163,000	220,300 176,200 156,900	50-54	240,700 217,800 721,900	122,900 111,200 368,800	117,800 106,600 353,100

Figures supplied by Social Analysis Branch, Dominion Bureau of Statistics.

<sup>\*</sup>These estimates do not take into account interprovincial migration, figures for which are not available for intercensal years.

The rural and urban distribution of the 1949 esti-	mated popu	ulation was as
follows:—	Assessed	
Population Group	Population	Per cent
Incorporated centres *10,000 population and over		43.9
Incorporated centres *5,000 to 10,000 population	266,798	6.0
Incorporated centres *1,000 to 5,000 population	361,257	8.1
Rural Population (including incorporated centres under		
1,000*)	1,844,812	41.8
*As at Census of 1941.		

Births and deaths for the year 1949 are classified by place of residence, marriages being classified by place of occurrence.

Tables 7, 8, 23, 24, 30 and 31 have totals by place of occurrence and place of residence.

#### Natural Increase

The natural increase in the population and the computed rates for the period 1922 to 1949 are shown in Table C.

TABLE C—NATURAL INCREASE AND NATURAL INCREASE RATES, ONTARIO, 1922-1949

		1111(10, 1722 171		
Year	Live Births	Deaths	Excess of Births over Deaths	Natural Increase Rate per 1,000 Population
1922	71,430	34,034	37,396	12.6
1923	70,056	35,636	34,420	11.5
1924	71,510	33,078	38,432	12.6
1925	70,122	33,960	36,162	11.6
1926	67,617	35,909	31,708	10.1
1927	67,671	34,775	32,896	10.2
1928	68.510	37,128	31,382	9.6
1929	68,458	38,123	30,335	9.1
1930	71,263	37,313	33,950	10.0
1931	69,209	35,705	33,504	9.8
1932	66,842	36,469	30,373	8.7
1933	63,646	35,301	28,345	8.0
1934	62,234	35,119	27,115	7.7
1935	63,069	36,317	26,752	7.4
1936	62,451	37,571	24,880	6.9
1937	61,645	38,475	23,170	6.3
1938	65,564	36,890	28,674	7.9
1939	64,123	37,530	26,593	7.2
1940	68,524	38,503	30,021	8.0
1941	72,262	39,226	33,036	8.7
1942	78,192	39,119	39,073	10.0
1943	81,173	41,063	40,110	10.2
1944	78,090	39,781	38,309	9.7
1945	78,974	39,499	39,475	9.8
1946	97,446	39,758	57,688	14.1
1947	108,853	41,619	67,234	16.0
1948	104,195	42,364	61,831	14.3
1949	106,601	43,379	63,222	14.3

The natural increase rate has showed a general downward trend from 1922 to 1937, with a considerable recovery taking place in births since 1938. The main factors affecting the natural increase were a general falling birth rate and a relatively stable death rate for the total population despite an increase in the deaths among the higher ages which is directly associated with an ageing population. A slight decrease in the birth rate was evident in 1944 and 1945, a definite increase for the years 1946, 1947, 1948 and 1949 with the year 1947 showing the highest rate ever attained.

#### **Births**

Table D presents an historical summary of births, stillbirths and illegitimate births, together with computed rates for each, while Chart 1 portrays the general trends over the same period.

TABLE D—SUMMARY OF LIVE BIRTHS, STILLBIRTHS AND ILLEGITIMATE BIRTHS, AND RATES, ONTARIO, 1922-1949

The number of live births has shown a more or less general decrease from 1922 to approximately 1937 when 61,645 births were registered. There was some recovery up to the war period followed by a decided increase accompanying the war. The crude birth rate of 20.7 in 1943 was 20 per cent higher than in 1939, and was as high as that attained in 1929, a prosperity period. There was a definite increase in 1947 when the rate was 26.0 decreasing slightly in 1948 and 1949 when the rate was 24.2.

The stillbirth rate, on the other hand, has been on an extremely encouraging downward trend with a reduction of over 57 per cent since 1922. In 1922 for every 1,000 babies born alive, 43 were stillborn, while in 1949 there were 18 stillborn—a fact which may be taken as a partial reflection of the improved health of mothers in the province and the improvement in obstetrical services.

It is to be noted that the number of illegitimate births for the year 1949 has dropped to 3,802. This figure represents children born to unmarried mothers. Tables 10, 11 and 13 show that there were 488 children born to widowed, divorced and separated mothers.

Tables E, F and G provide a breakdown of births by age of mothers for the same three groups, and indicate to some degree the extent to which age has contributed to the trends outlined above, while Chart 2 provides an interesting picture of the age distribution over the same period on the basis of five-year averages.

NOTE:—Births to mothers of "not stated" ages have been distributed on the basis of specified ages.

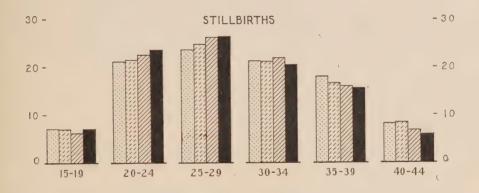

#### Chart 2

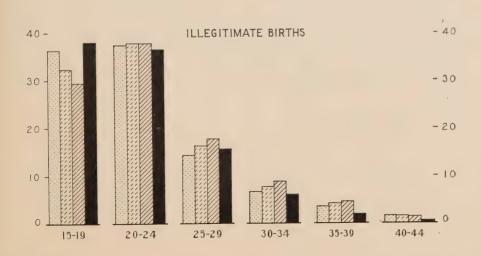

# PERCENTAGE OF LIVE BIRTHS, STILLBIRTHS AND ILLEGITIMATE BIRTHS

IN EACH AGE GROUP OF MOTHERS
'ONTARIO

FIVE-YEAR AVERAGES 1931 - 1945 AND FOR THE YEAR 1949

There has been a general tendency during the past two decades towards younger motherhood. For example, of every 100 babies born alive in 1922, 6 were to mothers under 20 years of age, over 24 to mothers 20-24, and 28 to mothers 25-29 or a total of 58 children to mothers under 30 years of age. In 1949 of every 100 live births, 7 were born to mothers under 20, 29 to mothers 20-24, and 31 to mothers 25-29 or a total of 67 children to mothers under 30 years of age.

As a partial effect of the trend towards younger motherhood, a greater percentage of stillbirths is now occurring at the younger ages than was the case in 1922. In 1949, 31 per cent were to mothers below 25 years of age as compared with 25.7 per cent in 1922. In 1949 of every 100 stillbirths, 42 were to mothers over 30 years of age as compared with 50 in 1922 and 47 in 1931.

There are indications that the number of stillbirths per 1,000 deliveries has been decreasing at an encouraging rate over the past two decades, and that this has been evident for each age-group of mothers, although the fact remains that the risk of stillbirth delivery increases with age. The following summary sufficiently indicates the general trend in this respect over the 20-year period. For example, of every 1,000 deliveries among mothers 15-19 in 1949, 17 were stillborn as compared with 29 in the period 1922-27; among mothers 20-24 years of age, 15 as compared with 30; among mothers 25-29 years of age, 15 as compared with 33, with similar encouraging figures for older mothers, although the risk of stillbirth delivery increases rapidly for mothers over 35 years of age.

#### AVERAGE NUMBER OF STILLBIRTHS PER 1,000 DELIVERIES

Years			Age of	Mother		
	15-19	20-24	25-29	30-34	35-39	40 and
1922-27	29	30	33	30	40	64
928-32	27	27	30	37	48	63
933-37	27	25	28	34	45	64
938-42	24	21	25	31	43	58
943-47	18	17	20	24	33	47
948	15	16	15	22	29	38
949	17	15	15	20	29	40

With respect to illegitimacy, Table G and Chart 2 indicate that the great majority of the illegitimate live births occur to mothers under 25 years of age. Of every 100 such births in 1922, 74 were to this group of mothers, as compared with 75 in 1949.

#### **Infant Mortality**

Table H and Chart 3 both show very clearly the declining trend in the number of deaths of children under one year of age. This decline in trend indicates, to a large extent, the success of a long range programme directed, during the last two decades, at the reduction of infant mortality.

There was a reduction in the total number of infant deaths from 3,961 in the period 1931 to 1935 to 3,275 in the period 1941 to 1945. This reduction is apparent in every monthly age-group. The increases which are noted from 1941 to 1949 must be considered in comparison with the extensive increase in the number of births during the same years. The following summary indicating the number of infant deaths per 1,000 live births presents a picture of the rapid reduction in infant morality. The rate of 35 per 1,000 live births in 1948 was the lowest ever recorded, showing a slight increase to 37 in 1949.

#### INFANT MORTALITY

ONTARIO

DEATHS AT EACH AGE PERIOD

FIVE -YEAR AVERAGES 1931-1945 AND FOR THE YEAR 1949

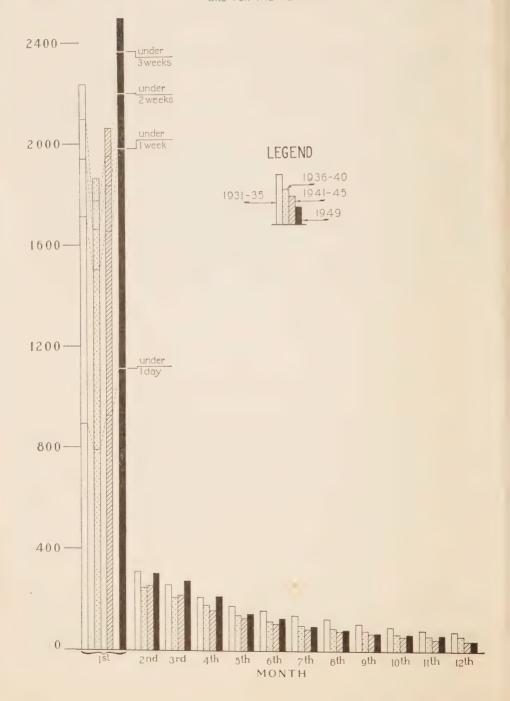

Table 1 which presents the deaths and rates for certain causes brings out the fact that there has been a notable reduction in deaths attributable to whooping cough except for 1947 when there was a marked increase. Influenza has fluctuated over the period showing the effect of minor epidemics. In 1947, 1948 and 1949 there was an increase in the deaths from diseases of the respiratory organs, and there has been no apparent improvement in the death rate from malformations.

#### Maternal Mortality

From Table K, it will be noted that a considerable reduction in the number of deaths of mothers during childbirth has taken place during the past 20 years, and particularly during the past 5 years, with the 1949 rate being considerably below the average of the last decade. In general, the reduction in the rate seems to be apparent in all age groups.

TABLE K-MATERNAL DEATHS, AND RATE PER 1,000 LIVE BIRTHS, BY AGE, ONTARIO, 1926-1949

<sup>\*</sup> Rates not computed because of small numbers.

The tables which follow present the distribution of maternal deaths during 1949 by locality, as well as deaths of women not directly classified as due to pregnancy or child-birth, but which were associated therewith.

The rates shown in Table L are of special interest in that they indicate clearly the general downward trend in maternal mortality in cities, towns and rural areas of the province, the rates for 1949 being 1.3 per 1,000 live births in cities, 0.7 in towns and 1.2 in the rural areas.

#### General Mortality

Table N presents an historical summary of deaths by sex in the province and the computed crude death rates over a 28-year period while Chart 1 presents a graphic picture of the general trend in the rate.

Over the past two decades three main trends are apparent. From 1922 to 1930 the rate averaged close to 11 deaths per 1,000 population, dropping rapidly in 1931 and 1932, establishing a rate at about 10 deaths per year per 1,000 population, dropping to 9 per 1,000 of population for the years 1945 to 1949.

The death rate among males has been consistently higher than that among females and there are indications that this divergence between the two rates has been widening during the past decade or more.

TABLE N-DEATHS (EXCLUSIVE OF STILLBIRTHS) AND DEATH RATES PER 1,000 POPULATION, ONTARIO, 1922-1949

1949.	43,379	24,123	19,256	9.8	10.8	8.8

Table O presents both male and female crude death rates for each 5-year age-group, based on the population as enumerated at the censuses of 1941 and as estimated for the years 1942 to 1949. There are several features with respect to changing death rates which are worthy of comment. Notable among which is the remarkable decrease in the death rate of children under 5 years of age from 13.6 in 1942 to 11.1 in 1949 for males and from 10.5 in 1942 to 9.0 in 1949 for females. Similar declines are apparent in other age-groups.

This latter fact is clearly portrayed in Chart 4 which depicts the percentage of deaths occurring in each age-group of the population.

#### Causes of Death

The deaths shown in Table P are for selected causes or groups of causes to which, during the past 10-year period, more than 75 per cent of total deaths have been recorded. A large part of the increase in 1941 in diseases of the heart and intracranial lesions of vascular origin and the decrease in diseases of the arteries is due to changes in classification in the "Fifth Revision of the International List of Causes of Death." The increase in diabetes in 1941 is partly due to a change in preference when two causes are mentioned on a death certificate.

(1) Per c	ent of tot	al dea													

(1) Fer cent of total deaths.
(2) Rate per 100,000 population.
Nore: Its should be noted that the effects of certain changes in classification and rearrangement of titles provided in the Fifth Revision of the International Nore: List oblight be noted that the effects of causes of Death are apparent in the following: Diseases of the heart, Diseases peculiar to the first year of life, Diseases of the arteries and intracranial lesions of vascular origin.

#### The Four Chief Causes of Death in Each Age-Group

Table Q shows the four primary causes of death in each age group for 1949. It will be seen that violent or accidental deaths hold first place in every age group from 1 to 39 years of age. From 10 to 29 years of age tuberculosis is the second chief cause of death and fourth in the 30 to 39 year group. Pneumonia, bronchitis and influenza, taken as a group, are important in the younger age groups. Cancer holds fourth place in age group 5-9 years but does not appear as a main cause of death until the late 30's, the number of deaths increasing in each older age group. In general, diseases of the heart and arteries, cancer and intracranial lesions of vascular origin are the primary causes of death of persons over 50 years of age.

#### Mortality from Notifiable Diseases

A summary of deaths and death rates from notifiable diseases is shown in Table R (1) and R (2) for the last 10 year period. In general, from 1940 diphtheria, erysipelas, scarlet fever, typhoid fever have been on a general downward trend, but in 1944, 1945, 1946 and 1947 there was an increase in diphtheria. Deaths from influenza have shown a decided decline except for the years 1943 and 1944. Deaths from poliomyelitis have shown the same trend, except for the years 1946, 1947, 1948 and 1949 when there was a definite increase, as well as those from whooping cough except for the years 1941 and 1947. Deaths from tuberculosis are discussed in detail in the section to follow.

# DEATHS FROM TUBERCULOSIS, CANCER AND PNEUMONIA

ONTARIO, 1900-49
Retes per 100,000 population

#### Mortality from Tuberculosis

Table S (1) shows the deaths from all forms of tuberculosis in the province from 1940 to 1949. Table S (2) shows the death rates per 100,000 population classified by the age of the decedents for 1945, 1946, 1947, 1948 and 1949. During the year 1949 tuberculosis mortality rate was the lowest ever recorded in Ontario, that of 15.6 per 100,000 of population. This is a decrease of 23 per cent over 1948 rate of 19.2. Substantial decreases are noted in all age groups as shown in Table S (2) with the death rate under one year of age standing at 1.9, compared with 11.7 in 1945, and for ages 25-29 the rate is now 11.4 while in 1945 it was 23.1. Chart 5 illustrates the decided reduction in mortality from tuberculosis which has taken place since the beginning of the century.

Table Z in Part 1 of this report gives details of deaths and death rates for counties according to place of occurrence and place of residence for the year 1949.

#### Mortality from Cancer

Chart 5 illustrates the steady upward trend in the mortality rate from cancer since the beginning of the century. The increase in the total number of deaths since 1940 is shown in Table T (1) and is apparent in most of the age-groups particularly among older persons. In addition the general cancer death rate has increased over the past decade, standing at 136.1 deaths per 100,000 population in 1949, as compared with 129.4 in 1940. Table T (2) shows the rate from 1940 to 1949 by sex and indicates that the female rate is higher than the male rate, but the death rate for males has increased more rapidly than that for females.

<sup>\*</sup>Total includes deaths where age was not stated, as follows: 1940, 2 males; 1942, 1 male; 1943, 1 female; 1944, 1 male, 1945, 1 male and 1 female; 1946, 1 male and 1 female; and 1949, 3 males.

TABLE T (2)—DEATH RATES PER 100,000 POPULATION FROM CANCER, BY SEX, ONTARIO, 1940-49

Year	Total	Male	Female
1940. 1941. 1942. 1943. 1944. 1945. 1946. 1947. 1948.	129.4 130.2 128.9 132.6 132.1 132.2 132.0 136.8 138.2 136.1	121.0 123.2 121.3 127.4 126.5 125.6 127.7 134.3 134.2 135.6	138.0 137.4 136.7 137.9 137.8 138.9 136.4 139.4 142.4 136.6

The number of deaths from cancer classified by sites affected is given in Table U for the period 1940 to 1949. Cancer of the digestive organs and peritoneum accounts for almost half of the deaths from this disease, with an increase of 13.3 per cent in the number of deaths occurring in this group since 1940. The number of deaths from cancer of the male and female genital and urinary organs has increased 29.4 per cent since 1940, cancer of the breast 22.1 per cent, while cancer of the respiratory organs has more than doubled during the same period.

#### Mortality from Pneumonia, Bronchitis and Influenza

In Chart 5 is a curve showing the trend in the death rate from pneumonia, a disease which may be affected by epidemics as illustrated by the peaks of 1907, 1916 and 1918. During the twenty years from 1925 to 1945 the death rate from this disease showed a general downward trend. The decrease was more noticeable after the introduction of the sulpha drugs for the treatment of respiratory diseases. The rate was 79.5 per 100,000 in 1924, 44.2 in 1941 and 40.4 in 1949.

Table U (1) shows the number of deaths from influenza, bronchitis and pneumonia and indicates the fluctuation in the number of deaths recorded as due to influenza.

TABLE U (1)—DEATHS FROM PNEUMONIA, BRONCHITIS AND INFLUENZA IN ONTARIO, 1939-1949

Int. List No.	Cause	1939	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949

#### Special Classes of Accidental Deaths

Table V shows of the 2,658 deaths in 1949 cross-classified as to nature of injury, 1,058 were due to crushing, 913 to falls, 347 to drowning, 127 to burns, 114 to poisonous gas, 74 to mechanical suffocation, 8 cutting or piercing instruments, 17 electric currents. Of these injured by crushing 715 deaths were due to automobile accidents (excluding trains or street-cars), 70 to railway accidents (excluding motor vehicles) and 33 to air transport accidents.

## TABLE V—CLASSIFICATION OF ACCIDENTAL DEATHS ACCORDING TO THE NATURE OF INJURY

These accidental deaths are classified according to circumstances involving the accident under rubrics 169 to 176, 178, 180, 181, 182, 183, 185, 186, 187 and 193

#### Marriages

From Table W it will be noted that there have been significant fluctuations in the number of marriages in the province since 1925, each of which have reflected general economic trends. For example, there was a general increase in marriages and in the marriage rate leading up to 1929, a prosperity period, followed by a decline coincident with the depression period which continued until approximately 1933. This was followed by a return to a more stable economic condition which is reflected by an increase in both the total number of marriages and the marriage rates. The effect of the war is clearly apparent in the relatively high rates of 11.0, 11.4 and 11.7 per 1,000 population during the three years, 1940, 1941 and 1942. In 1943 the rate decreased to 9.2 followed by a further decrease to 7.9 in 1944, and an increase in 1945 to 8.5, with a further increase in 1946 to 11.2, decreasing in 1948 to 10.0 and in 1949 to 9.8.

TABLE W-MARRIAGES AND MARRIAGE RATES PER 1,000 POPULATION, ONTARIO, 1925-1949

Year	Number	Rate per 1,000 Population	Year	Number	Rate per 1,000 Population

#### **Divorces**

In Ontario, divorced persons form a very small proportion of the population as compared with some of the other countries of the world. The following summary indicates the number and percentages of such persons in the population of the province as enumerated in the past three censuses.

	1921*	1931	1941
Divorced persons—Male	1.135	1.071	2.291
Female	1.369	1.015	2,865
Per cent of population—Male	0.08	0.06	0.12
Female	0.09	0.06	0.15
*Including legal separations.			

An historical summary of the number of marriages dissolved in Ontario since 1919 is presented in Table X. Previous to 1920 very few divorces were granted in the province. There was no appreciable increase in the number till the late 1920's, but since the transfer in 1930 of jurisdiction from the Dominion Parliament to provincial courts there has been a steady annual increase (except in 1939) in the number of divorces. Previous to 1930 a record number of 213 (1928) divorces were granted. From an annual average of somewhat over 300 in the early 1930's the number has increased rapidly to 949 in 1941, 1,185 in 1942, 1,376 in 1943, 1,510 in 1944, 1,948 in 1945, 2,639 in 1946, 3,509 in 1947, 3,161 in 1948, and 2,480 in 1949.

In the early 1920's the majority of the successful applicants were husbands but since that period dissolutions granted on the application of wives have been in the great majority. Since 1935 for every 1,000 divorces granted to wives, an average of 600 have been granted to husbands as applicants, the ratio in 1949 being 642 per 1,000 divorces granted to wives.

# TABLE X—DISSOLUTIONS OF MARRIAGE (DIVORCES) AND RATE PER 100,000 POPULATION, 1919-1949, AND RATIO OF DISSOLUTIONS TO MALES AND FEMALES, 1935-1949
